

STYLI AND ACCESSORIES

MAXIMUM PRECISION, PIONEERING INNOVATION
AND CONVINCING ECONOMICS

Probe components from Mitutoyo: Add the touch of perfection to your quality assurance.

FOR CMM
STYLI FOR

Industrial quality assurance requires increasing universality, flexibility and the ideal shape for absolute precision. Here Mitutoyo styli show exactly what they are capable of: maximum precision, pioneering innovation and convincing economics.

It is not only the technical capabilities of Mitutoyo styli that stand out from the crowd. Equally impressive is the integrated nature of the entire concept, right through to the seamless service environment.

This concept forms the customer-oriented basis for a multi-faceted range of services that will open up a new dimension of quality assurance to every user: world-class measuring technology from Mitutoyo.

Steel, aluminium or ceramics? Ruby, zirconium oxide or silicon nitride?

The Mitutoyo product line includes over 600 probe components plus highly specialised equipment - listed in this current product information - to provide the best possible solution to your specific measurement needs with a sophisticated sense of touch. For measurably better results.

Mitutoyo means that you can count on the experience, competence and performance of a one of the world's leading measurement technology specialists, as well as. And a customer- focused service without equalcomparison.

Mitutoyo: performance made perfect.

Styli made by Mitutoyo: Tip top quality.

Which stylus is best suited, and under which conditions, for use with your measuring equipment, for your specific measuring task? Mitutoyo offers you the answers. We have 30 years of experience in developing and manufacturing styli, based on cutting-edge materials development, our experts know which material and which combination will enable you to achieve your goals reliably and accurately. Whatever you choose, the result is the same: the best.

Our expertise and use of the highest-quality materials guarantee products of unparalleled excellence:

The materials we use for contact points

Ruby

As the hardest of all probe element materials, ruby is the perfect all-rounder when it comes to manufacturing spherical contact points that must be highly resistant to wear. Contact points made of ruby have been used as tried and tested equipment for most standard applications for decades. The low specific density of ruby enables the mass of the stylus tip to be kept as small as possible – this effectively allows the elimination of false triggers caused by mass inertia when the CMM moves or vibrates.

Zirconium oxide

Because of the specific surface properties of contact points made of zirconium oxide – a ceramic compound – they are the acknowledged as the best choice for aggressive scanning of abrasive surfaces, such as workpieces made of cast iron. Zirconium oxide has virtually the same hardness and wear-resistant properties as ruby.

Silicon nitride

Silicon nitride is extremely hard and superbly wear-resistant, with the least surface roughness of all ball materials. Specific advantage: silicon nitride is not attracted by aluminum and therefore coats the surfaces of workpieces made of aluminum alloy to a much lesser extent than other ball materials.

The materials we use for bases and stylus stems

Steel

The primary material of choice for high-strength precision styli that enable very accurate measuring tasks. Its superb material strength makes steel an excellent choice of material for manufacturing styli or reference probe elements.

Carbon fiber tube

Thermal expansion coefficient range is virtually undetectable at temperatures of between 15 and 40 degrees centigrade. Mitutoyo uses carbon fiber tube for styli with outstanding quality, sophisticated styli configurations and probe extensions.

Aluminum alloy

Lightweight and stable, and therefore frequently used for probe extensions. Styli stems or extensions made of aluminum alloy perform best in measuring labs with stable temperatures and accordingly, the lowest possible temperature gradients.

Carbon fiber

The highest-quality material with an expansion coefficient of virtually zero at ambient temperatures of up to 45 degrees celsius. Carbon fiber is also very lightweight and extremely stiff, making it particularly suitable for the manufacture of long styli.

Tungsten carbide

Bend-resistant stylus stems made of tungsten carbide are ideal for virtually all standard applications in the measuring lab with its stable ambient temperature. A durable material that has proved its worth.

Ceramic

Very lightweight and extremely stiff. The ideal material, especially for long stems. Their low tendency to expand in higher temperatures makes ceramic styli also suitable for use in production surroundings.

Titanium

Titanium is remarkably stiff yet has a relatively low density. Probe components made of titanium offer the outstanding characteristics of being extremely rigid and stable, yet surprisingly lightweight. Mitutoyo uses the material primarily for bases, connecting pieces and extensions for measuring styli.

TECHNICAL SUPPORT - CHECKLIST

- The shortest, most stable stylus possible must be used. When using longer stylus parts, always check that they are sufficiently stable.
- To be sure that the mount is secure, make sure that your styli are free from defects, especially on the seating area and thread.
- Make sure the probe component is completely securely attached to minimise variations.
- Remember to replace older styli regularly.
- Take account of the ambient temperature and conditions when using thermally stable components.
- The manufacturer's instructions for setting up stylus configurations will specify the permitted masses; always refer to these.
- Use as few individual components as possible and keep superfluous thread connections to a minimum.
- It is advisable to use silicon nitride balls when scanning aluminium.
- The balls used should be as large as possible. Large ball styli perform a mechanical filter function on the workpiece surface. Due to their size, they have hardly any impact on the surface's fine structure, thus eliminating flyers or random measurement variations.
- As far as possible you should always place the styli at right angles to the planes you are measuring. You can use angled cubes and knuckles to align styli correctly on angled measuring planes. Use the same methods to measure angled bores.
- Make sure that you employ the right dynamics and measuring strength for the stylus components you are working with. Decrease these as needed when working with small ball, slim-stemmed styli.

**Whatever your challenges are,
Mitutoyo supports you from start to finish.**

Mitutoyo is not only a manufacturer of top quality measuring products but one that also offers qualified support for the lifetime of the equipment, backed up by comprehensive services that ensure your staff can make the very best use of the investment.

Apart from the basics of calibration and repair, Mitutoyo offers product and metrology training, as well as IT support for the sophisticated software used in modern measuring technology. We can also design, build, test and deliver bespoke measuring solutions and even, if deemed cost-effective, take your critical measurement challenges in-house on a sub-contract basis.
